

Python Regex Cheat Sheet (with Examples)

Character Classes

Pattern	Meaning	Example
\w	Word character (a-z, A-Z, 0-9, _)	\w+ -> 'Hello123' in 'Hello123!'
\d	Digit (0-9)	\d+ -> '2025' in 'Year 2025'
\s	Whitespace	\s -> ' ' in 'Hello World'
.	Any character except newline	a.b -> 'acb', 'a#b'
[a-z]	Lowercase letter range	[a-z] -> 'h' in 'hello'
[^0-9]	Not a digit	[^0-9]+ -> 'abc' in 'abc123'

Quantifiers

Pattern	Meaning	Example
+	One or more	a+ -> 'aaab' -> ['aaa']
*	Zero or more	a* -> 'aaab' -> ['aaa', '', '']
?	Zero or one	a? -> 'aa' -> ['a', 'a', '']
{3}	Exactly 3 times	a{3} -> matches 'aaa'
{2,}	At least 2 times	a{2,} -> 'aa', 'aaa'...
{2,4}	Between 2 and 4 times	a{2,4} -> 'aa', 'aaa', 'aaaa'

Anchors (Position Matching)

Pattern	Meaning	Example
^	Start of string	^Hello -> matches 'Hello World'
\$	End of string	World\$ -> matches 'Hello World'
\b	Word boundary	\bword\b -> matches ' word ' not 'swordfish'

Groups & OR

Pattern	Meaning	Example
(ab)	Capturing group	(hi)+ -> 'hihi'
(?:ab)	Non-capturing group	(?:hi)+ -> same, not stored
a b	OR logic	cat dog -> matches either

Substitution Example

Replace @, #, \$ between letters with a space

```
re.sub(r'(\w)[@#$(\w)', r'\1 \2', 'a@b') # Output: 'a b'
```
